```

## Introduction

It is the description of the implementation of a Unix shell program. A shell is simply a program that conveniently allows you to run other programs. Read up on your favorite shell to see what it does.

Implementation supports the following:

1. The internal shell command "exit" which terminates the shell.
2. A command with no arguments.
3. A command with arguments.
4. A command, with or without arguments, executed in the background using &.

## Code Hirechy:-

## Function Description :-

<b>char*</b> readInstruction();	This read line from the user.
<b>char**</b> get_arguments( <b>char*</b> line, <b>int*</b> background);	This function take the inserted line and begin to split this line to words After trimming all tabs and new line. And predict the type of the command if it will run on the background or not
<b>void</b> signalHandler( <b>int</b> signum);	When signal is interrupted it print in file that the child process has finished.
<b>void</b> execute();	Execute function is responseble for the running of the system function it
<b>int</b> main()	The essential function which running the shell function.

## ScreenShot:-

Running process :-

```

Shell> gedit &
Shell> cp
cp: missing file operand
Try 'cp --help' for more information.
Shell> cp --help
Usage: cp [OPTION]... [-T] SOURCE DEST
or: cp [OPTION]... SOURCE... DIRECTORY
or: cp [OPTION]... -t DIRECTORY SOURCE...
Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY.

Mandatory arguments to long options are mandatory for short options too.
-a, --archive                same as -dR --preserve=all
--attributes-only            don't copy the file data, just the attributes
--backup[=CONTROL]          make a backup of each existing destination file
-b                           like --backup but does not accept an argument
--copy-contents              copy contents of special files when recursive
-d                           same as --no-dereference --preserve=links
-f, --force                  if an existing destination file cannot be
                             opened, remove it and try again (this option
                             is ignored when the -n option is also used)
-i, --interactive            prompt before overwrite (overrides a previous -n
                             option)
-H                           follow command-line symbolic links in SOURCE
-L, --link                   hard link files instead of copying
-L, --dereference            always follow symbolic links in SOURCE
-n, --no-clobber             do not overwrite an existing file (overrides
                             a previous -i option)
-P, --no-dereference         never follow symbolic links in SOURCE
-p                           same as --preserve=mode,ownership,timestamps
--preserve[=ATTR_LIST]      preserve the specified attributes (default:
                             mode,ownership,timestamps), if possible
                             additional attributes: context, links, xattr,
                             all
--no-preserve=ATTR_LIST     don't preserve the specified attributes
--parents                   use full source file name under DIRECTORY
-R, -r, --recursive          copy directories recursively
--reflink[=WHEN]            control clone/CoW copies. See below
```

```
aya@aya-Inspiron-5559: ~/CLionProjects/Unix-shell-program/C-Shell
aya@aya-Inspiron-5559:~/CLionProjects/Unix-shell-program/C-Shell$ ./main
-t, --target-directory=DIRECTORY copy all SOURCE arguments into DIRECTORY
-T, --no-target-directory        treat DEST as a normal file
-u, --update                     copy only when the SOURCE file is newer
                                than the destination file or when the
                                destination file is missing
-v, --verbose                   explain what is being done
-x, --one-file-system            stay on this file system
-Z                               set SELinux security context of destination
                                file to default type
--context[=CTX]                like -Z, or if CTX is specified then set the
                                SELinux or SMACK security context to CTX
--help                          display this help and exit
--version                       output version information and exit

By default, sparse SOURCE files are detected by a crude heuristic and the
corresponding DEST file is made sparse as well. That is the behavior
selected by --sparse=auto. Specify --sparse=always to create a sparse DEST
file whenever the SOURCE file contains a long enough sequence of zero bytes.
Use --sparse-never to inhibit creation of sparse files.

When --reflink[=always] is specified, perform a lightweight copy, where the
data blocks are copied only when modified. If this is not possible the copy
fails, or if --reflink=auto is specified, fall back to a standard copy.

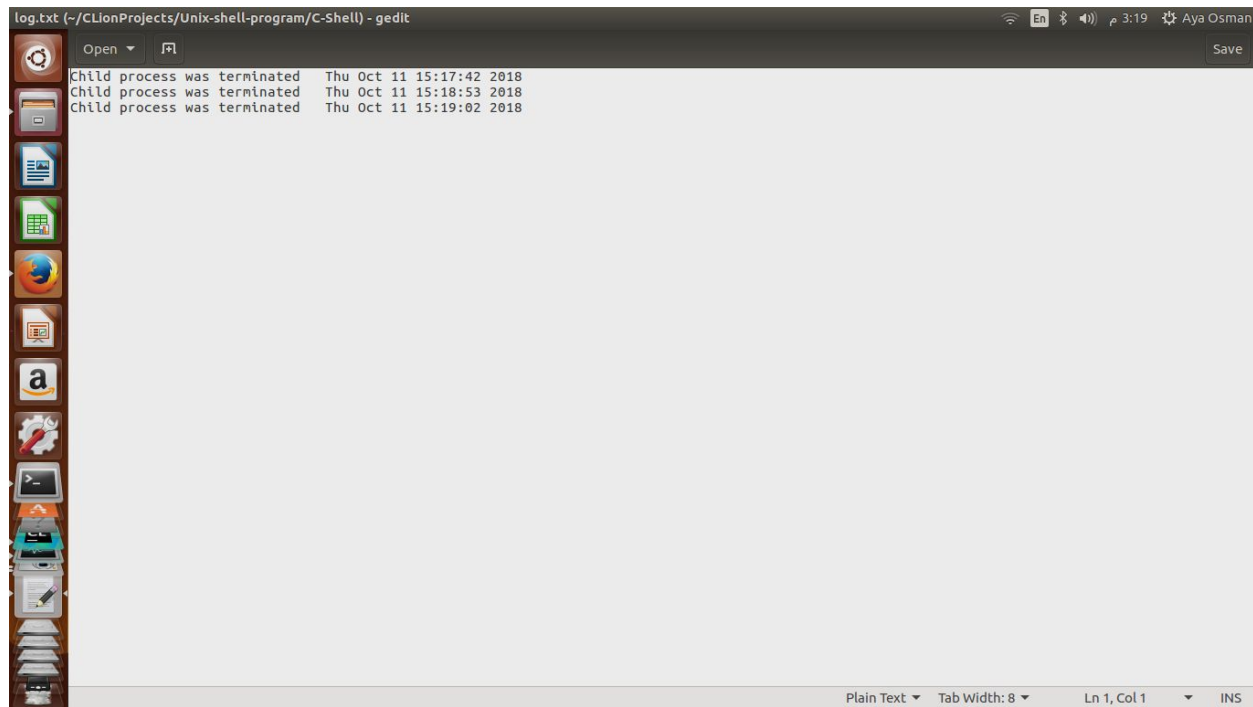

The backup suffix is '-', unless set with --suffix or SIMPLE_BACKUP_SUFFIX.
The version control method may be selected via the --backup option or through
the VERSION_CONTROL environment variable. Here are the values:

    none, off      never make backups (even if --backup is given)
    numbered, t    make numbered backups
    existing, nil  numbered if numbered backups exist, simple otherwise
    simple, never  always make simple backups

As a special case, cp makes a backup of SOURCE when the force and backup
options are given and SOURCE and DEST are the same name for an existing,
regular file.

## Log File

The screenshot shows a gedit text editor window titled "log.txt (~/.CLionProjects/Unix-shell-program/C-Shell) - gedit". The window contains three lines of log entries, each indicating a terminated child process with a timestamp. The desktop environment is Ubuntu, with a sidebar on the left containing icons for various applications like the Dash, Home, Files, and Firefox. The bottom status bar shows "Plain Text", "Tab Width: 8", "Ln 1, Col 1", and "INS".

```
log.txt (~/.CLionProjects/Unix-shell-program/C-Shell) - gedit
Child process was terminated Thu Oct 11 15:17:42 2018
Child process was terminated Thu Oct 11 15:18:53 2018
Child process was terminated Thu Oct 11 15:19:02 2018
```

The screenshot shows a terminal window titled "Terminal" with a browser window in the background. The terminal displays the output of a command, showing help text for the 'cp' command. The user then runs a series of commands to open Firefox, gedit, and Facebook, and finally runs 'execvp' to execute the command. The desktop environment is Ubuntu, with a sidebar on the left containing icons for various applications like the Dash, Home, Files, and Firefox. The bottom status bar shows "Ubuntu Start Page", "Facebook", and "Search or enter address".

```
Terminal
Ubuntu Start Page x Facebook x +
Search or enter address
aya@aya-Inspiron-5559: ~/.CLionProjects/Unix-shell-program/C-Shell
numbered, t make numbered backups
existing, nil numbered if numbered backups exist, simple oth
erwise
simple, never always make simple backups
